

The Vertos you played: an account at the end of a Verto

What the end screen asks, what the email opens, and what a respondent gets for giving their address – the Vertos they played, their answers against everyone else, a wallet of the tokens they collected, the impact the Verto turned out to have, and the next one to play. Plus where the creator writes the ask, and where they write the impact months later.

- Fictional: Haverley Town Council & Riverside Youth Trust
- Player and /you at 390×844 and 1280×800
- Mail at 600px
- Spec for the implementer at the foot

00 Worked example AI End screen, mobile A2 The block's five states A3 End screen, desktop B The sign-in email CI /you, mobile C2 /you, desktop

The worked example

The same Verto the share deck uses – Haverley Town Council's *"Car-free High Street"*, 1,284 responses, the council deciding on 14 October. Today it ends, the respondent closes the tab, and the comparison, the tokens and any chance of telling them what the council decided all go with it. Every board below uses this copy and this person:

join_title – the ask

"Keep your Vertos" · "Get a link by email – no password. You'll see your answers next to everyone else's, and hear what happens next." · "Send me a link"

Priya · p.****@gmail.com · four Vertos, one device, three of them claimable

https://app.playverto.com/you – outside /play/ , which is the service worker's whole scope

VERTO	ORGANISATION	TOKENS IT AWARDS	PLAYED	WHAT IT DEMONSTRATES	CLAIMABLE FROM THIS DEVICE?
Car-free High Street	Haverley Town Council	 Ideas ·  Voice	Today	Impact awaited – the council decides on 14 October	Yes – session_token , this tab
Where the new play area goes	Haverley Town Council	 Green ·  Voice	12 May	Impact delivered , with what changed	Yes – it has a leaderboard, so a durable key exists
How safe do you feel after dark?	Riverside Youth Trust	 Insight	3 March	A second organisation – two vocabularies, two senders	Yes – ask-once questions, so a durable key exists
Library opening hours	Haverley Town Council	–	18 February	The honest gap: a plain Verto keeps no durable identity	No – player_key_digest is NULL on those responses
High Street, one year on	Haverley Town Council	 Ideas ·  Voice	Not yet	The follow-up – wave 2 of the first Verto	–

Five Vertos, four of them played, and only three of those recoverable – because the browser only mints a durable key when a Verto has a leaderboard, a contact gate, an ask-once question or device-basis No retests (player_controller.js:209 , survey.rb:2450). That asymmetry is not a rough edge to smooth over in the copy; it is the reason board A2 counts what it found instead of promising "all your Vertos".

THANK-YOU SCREEN · JOIN BLOCK ENABLED

NOTES

- 1 The reward still comes first. "See your results compared to others" stays the primary CTA — nothing about this feature is worth demoting the one thing the respondent was promised. §4
- 2 The join block takes the second slot, and the share card moves down. The share deck put its card here; where both are on, this deck's position is that the ask which gives the respondent something outranks the ask which gives the creator something. A creator who disagrees can turn either off — they are independent switches. §4
- 3 Creator-written copy, three fields, each falling back to a locale default when blank so a Verto that never opens the panel still reads properly (board I). Tinted rather than outlined, because it is the only block on the screen asking for something back. §4
- 4 Email and one button. No password field, because there is no password — the link in the mail is the sign-in (board B). One field is also all that survives a thumb on a bus. §1
- 5 It counts what it found; it never says "all your Vertos". The client reads its own `localStorage` and can only offer the Vertos that minted a durable key. Priya played four and this says two, because `Library opening hours` kept no identity and the Verto she is on is claimed separately. §2 §3
- 6 Ticked by default, and it has to be legible in one line — this is the moment the app starts joining Vertos it has always kept apart, so the fine print underneath is not decoration. §9

The block costs about 190px on a screen that already scrolls. Everything below it — `forward_url`, regions, Play again — is unchanged and simply moves down. On a Verto with the block off, the screen is exactly what it is today.

1 · ASK

KEEP THIS

Keep your answers, and hear what the council decides.

We'll email you once – when Haverley Town Council publishes what it decided in November. No password, no account to remember.

your@email.com

Send me the link

✓

Also add the 2 other Vertos this device remembers

One email to sign in. We never post anything, and you can delete the account in one tap. What we keep

The button is inert until the field parses as an address, so the first tap is never a failure.

2 · TYPED

KEEP THIS

Keep your answers, and hear what the council decides.

We'll email you once – when Haverley Town Council publishes what it decided in November. No password, no account to remember.

priya.n@gmail.com

Send me the link

✓

Also add the 2 other Vertos this device remembers

One email to sign in. We never post anything, and you can delete the account in one tap. What we keep

No "confirm your email" second field, and no password. There is nothing to get wrong twice.

3 · SENT

✓

Check your inbox

We've sent a link to **priya.n@gmail.com**. It signs you in and keeps this Verto – no password needed.

Didn't arrive? Send it again · Use a different address

1

Drawn by the Stimulus controller, not the server – the page it sits in is one cached HTML body shared by every respondent.

4 · ALREADY SIGNED IN

P

Saved to your Vertos

3 Vertos · 412 tokens

Open →

2

No ask at all. A respondent who already has an account is told what happened, not sold the thing they already bought.

5 · EMBEDDED, OR STORAGE BLOCKED

KEEP THIS

Keep your answers, and hear what the council decides.

We'll email you once – when Haverley Town Council publishes what it decided in November.

your@email.com

Send me the link

This Verto is embedded in another site, so we can't see anything else you've played here. The link will still keep **this** one.

3

The tick is gone rather than ticked-and-lying. Everything else works.

NOTES

- 1

Nothing here is rendered server-side. `/play/:token` is served from `cached_play_page` – one HTML body shared by every respondent, keyed on token, `updated_at`, locale and wave, with the header comment "nothing per-respondent is rendered into it" (`player_controller.rb:1189`). Adding the session to that key turns a per-link cache into a per-person one on what the same file calls ~45% of a journey's CPU. So the copy is ERB and the state is drawn client-side, exactly as `_renderTokenScore` and `_renderLeaderboard` already are. §6
- 2

Recognising a signed-in respondent needs one small JSON fetch – and every same-origin GET a `/play/` page makes still goes through the service worker's `networkFirst(PAGE_CACHE)` handler regardless of path. Excluding that endpoint is a change to the *worker's own behaviour*, so it is the one thing here that needs a `CACHE_VERSION` bump. §6
- 3

Vertos legitimately run in third-party iframes (`after_action :allow_embedding`), where storage is partitioned and the `player_session_id` cookie is third-party and mostly blocked. The block must degrade rather than look broken – and it must not claim to have found Vertos it cannot see. §2

A sixth state was drawn and cut: a "we already have this address" branch. There isn't one – an address that already has an account simply gets the sign-in link, which is also the only answer that doesn't tell a stranger whether an address is registered.

THANK-YOU SCREEN · DESKTOP

NOTES

- 1

Same card, same copy, same order – the desktop end screen is the mobile one in a wider box (`.preview-thankyou-card` at 520px), so there is nothing here to design twice. The block inherits the card's 400px action column rather than stretching to it.
- 2

The masthead already carries the organisation on desktop, so the block does not repeat it – the copy says "the council" because the creator wrote it that way, not because the app substitutes a name. §4

Nothing on this board is a separate implementation: one partial, rendered into the same `.play-end-actions` stack, styled by the classes that are already there.

FIRST TIME — WHAT THE LINK OPENS

1Welcome. What should we call you?

Optional — it's only used to greet you.

Priya

4☒ Email me when a Verto I've played has news, or when its organisation publishes a new one.

4☒ I agree to the Terms and Privacy notice.

2Open my Vertos

Consent is taken here, once, on a page the person arrived at by clicking a link in their own inbox — not on the end screen, where they are still finishing something else.

3

RETURNING — STRAIGHT THROUGH

✓

Welcome back, Priya

Car-free High Street has been added. You've now kept 3.

Open my Vertos

A returning respondent sees the claim confirmed and lands on `/you`. No second consent, no re-tick.

NOTES

- 1The subject names the organisation, not Playverto — the respondent has a relationship with the council, not with us. The preheader states the expiry, so an old link in a full inbox explains itself before it is opened.
- 2House mailer chrome, unchanged: `#272D4A` page, `#1C2034` card at 16px radius and 520px, the aqua CTA at `14px 32px`, the copy-paste fallback and the wordmark — `app/views/welcome_mailer/welcome.html.erb` is the file to copy. Both an `.html.erb` and a `.text.erb`, `X-Entity-Ref-ID` on every send, and the recipient's locale applied explicitly because a mailer runs in a job with no `Current.locale`. [§8](#)
- 320 minutes, and once. Minted with `generates_token_for :sign_in` on `Player`, following the three flows `User` already has (`:password_reset` 15 min, `:account_setup` 7 days, `:email_confirmation` 7 days). `Session` has no token column and must not grow one. [§1](#)
- 4Clicking the link is what proves the address is deliverable, which is what earns the right to send anything later — so `email_verified_at` is stamped here and nowhere else. The mail preference is a single tick with a plain sentence, because "the second one is out" is the whole reason the address was collected. [§8](#) [§9](#)

Deliberately absent: a "resend" that says whether the address exists, and any screen between the click and `/you` for a returning respondent. The landing page is a consent step the first time and a redirect every time after.

APP.PLAYVERTO.COM/YOU

NOTES

- 1 Outside `/play/`, deliberately. That path is the service worker's whole scope and its HTML is cached for offline use; a signed-in page has no business in a shared device's cache. `you` joins `NOINDEX_PATHS` (`application_controller.rb:19`) and carries `Cache-Control: no-store`. §6
- 2 The app's own ambient treatment — the four drifting orbs at `blur(120px)`, damped as they are on results surfaces. This is the dashboard's language, not a new one, because a respondent arriving here has already seen the player's.
- 3 Three, not four — and the header says three. Priya played four Vertos on this device; `Library opening hours` kept no durable identity, so there is nothing to claim it by and *the account does not know it exists*. It appears nowhere here, not even greyed out. Counting it would mean claiming knowledge the app does not have. §2 §3
- 4 Token piles read from `responses.token_totals` with that Verto's own `token_types` — its icons, its names, its amounts. Nothing here is normalised across Vertos, because nothing about them is comparable. §7
- 5 One badge per card, and it is the state that matters: impact **awaited**, impact **delivered**, or a **follow-up** available. A card with none of those is just a card. §5
- 6 Two organisations in one list is the whole point of an account — and it is also the thing the app has always refused to do. The crest, not just the name, so it reads as "who asked me", which is what the mail preferences are then scoped by. §8 §9

The empty state, not drawn: an account with one claimed Verto and nothing else says so plainly and offers nothing to browse — there is no public catalogue of Vertos to send someone to, and inventing one here would be inventing a feature.

APP.PLAYVERTO.COM/YOU · DESKTOP

NOTES

- 1

The wallet is a rail here and a tab on mobile – same numbers, same words. "412 across 3 Vertos and 2 organisations" is a total, and the sentence under it says so; the app already sums across token types inside a Verto (`leaderboard_rank_by: "all"`, `LeaderboardStanding#total`), so this is that same sum one level up. What does *not* follow is a board ranking players across Vertos – award sizes are a creator's free choice, so it would measure whose Verto you happened to play. §7
- 2

One follow-up, with the reason on the card. It is the creator's own pointer at another Verto or the next `SurveyWave`, not a recommendation the app invented – nothing in this codebase knows enough about a respondent to recommend anything, and it should stay that way. §5
- 3

The anonymous name is different on every Verto, and that is correct. `PlayerAlias` is one row per `(survey, identity digest)`, written once and never updated – Priya is *Clever Axolotl* on the two council Vertos and *Brave Pangolin* on Riverside's. An account gathers the standings; it does not merge the identities behind them, and the deck does not quietly unify the names to look tidier. §7

Deliberately absent from the rail: a streak, a level, a badge shelf. The tokens a creator awards are a device for getting through *their* Verto, not a currency this account is allowed to inflate into a game of its own.

/YOU/V/CAR-FREE-HIGH-STREET

TOO FEW ANSWERS YET

The same rule the player already enforces: the whole payload is refused under `Response::MIN_REGION_SAMPLE_SIZE` (5). An account does not become a way around small-cell suppression.

AND WHEN THE CREATOR TURNS COMPARISON OFF

`show_results_comparison` is the creator's switch and it stays theirs. The account keeps the Verto either way; it just has less to show.

NOTES

- 1 These are the rows the player already draws. `GET /play/:token/results` builds them (`aggregate_rows:1246`), `_renderComparison` renders them (`player_controller.js:2145`), and the strings are already written and translated — `player.comparison_title` is literally "Your answers vs everyone". The account's contribution is that they survive closing the tab, which today they do not. §7
- 2 The "Your answer" pill and the highlighted bar are the existing `.play-compare-mine` and `.play-bar-label.is-mine`. Nothing is restyled for this surface — a respondent should recognise the screen they saw at the end of the Verto.
- 3 These numbers can move, and the deck says so rather than pretending otherwise. `apply_token_totals` recomputes from the *current* cards on every save (`player_controller.rb:1155`), and the aggregates behind the bars are cached in 10-second windows — so a creator editing awards changes what a respondent "collected" in May. Either the claim snapshots the totals at completion, or the wallet is honest that it is a live view. §7 puts the decision in front of whoever builds it instead of burying it. §7
- 4 The impact strip is the same content board F carries, in its waiting state — a respondent who opens a Verto months later should find the answer to "what happened?" on the Verto, not only in an email they may have lost. §5
- 5 Share moves here too, and stays useful for as long as the Verto is open: the same card, the same generated image and the same creator-written headline the share deck specifies. A Verto that has closed drops it rather than sending friends to a dead link.

Not drawn, and deliberately: an "export my answers" button. The respondent-data export exists (`RespondentDataExport`) but is a creator-facing subject-access tool keyed on `session_token` or a respondent code — it does not know about accounts, and wiring it is §9's job, not a control to sketch here.

/YOU · WALLET

NOTES

- 1 412 is the same summation the product already performs – `LeaderboardStanding#total` adds a Verto's token types together whenever `leaderboard_rank_by` is "all". This is that sum one level up, and it is the only number on the screen that spans Vertos. §7
- 2 Piles come from `responses.token_totals`, keyed on `(survey_id, token_id)` – because token ids are *not* unique. `Survey#duplicate!` copies `token_types` verbatim and `sanitize_token_types` passes creator-supplied ids straight through (`survey.rb:1531`), so a duplicated Verto shares ids with its original. Keying on the id alone would silently merge two Vertos' piles. §7
- 3 The standing and the anonymous name come from the Verto's own `LeaderboardStanding` and `PlayerAlias`, unchanged – including the fact that the name differs per Verto. §7
- 4 Three rows, because the account holds three Vertos. Priya played a fourth on this device – `Library opening hours` – and it is not here and not greyed out, because a Verto with no durable identity leaves nothing to claim and the account genuinely does not know about it. The header and the list agree, which is the only way a respondent can trust either. §2
- 5 The sentence at the foot is not a disclaimer – it is the design. Anyone reading this wallet will ask why the numbers cannot be compared, and answering it once in the interface is cheaper than answering it in support.

Cut: streaks, levels, badge shelves, and anything that spends. Creator tokens are a device for getting through *that* creator's Verto; turning them into a platform currency would make every creator's design choice a lever on someone else's score.

I · AWAITED

WHAT HAPPENS NEXT

The council decides on 14 October

Haverley Town Council publishes the result in November. We'll email you when they do.

Written by the creator when they publish the Verto, so the promise is theirs and it is on the record. Nothing here is generated.

2 · DELIVERED

WHAT YOUR ANSWERS DID

The High Street closes to traffic at weekends from March

1,284 people answered and 62% wanted a weekend closure. The council voted for a 12-month trial on 14 October, starting 7 March.

- Deliveries move to a 7–10am window
- Two extra disabled bays on Mill Lane, after the accessibility answers

[Read the council's full report ↗](#)

Written weeks after the Verto closed, from the editor (board J). Publishing it is what sends the email.

3 · NOTHING YET, AND NO PROMISE MADE

Library opening hours

Haverley Town Council hasn't said what came of this one. If they do, you'll hear.

The commonest state, and the one a design like this usually forgets. It has to read as honest, not as an error.

NOTES

- 1

`impact_headline` (≤ 80) and `impact_body` on `surveys`, plus `impact_published_at`. Nothing like this exists today – the nearest thing in the codebase is the per-card `outcome` sentence the generators write (`survey.rb:863`), which is about what a *question* is for, not what the Verto changed. §5
- 2

The bullets are the substance, and they are optional. A creator who has only a sentence writes a sentence; the shape must not demand three achievements from a Verto that produced one decision. §5
- 3

No impact is the default and must stay comfortable. Most Vertos will never get one written. The copy says the organisation hasn't said, not that nothing happened – the app does not know which, and should not imply the harsher reading of a creator who simply hasn't come back.

Cut: any "impact score", any aggregate of impact across Vertos, and any prompt nagging a creator to write one. The first two would be numbers with nothing behind them; the third belongs in the creator's own mail, not in a respondent's account.

THE NEXT WAVE OF ONE THEY PLAYED

A `SurveyWave` of the same Verto. The app already runs before/after studies this way and already reports wave-over-wave deltas to the creator; what it has never had is a way to invite the same person back.

ANOTHER VERTO FROM THE SAME ORGANISATION

The creator picks it, from their own organisation's Vertos. There is no cross-organisation suggestion and no algorithm.

NOTHING TO SUGGEST

And it names the condition, so the promise made at sign-up and the promise made here are the same promise.

NOTES

1 Both kinds are the same stored thing: an ordered list of survey ids on the Verto, chosen by its creator (board J). A wave is not a special case in the data — it is another Verto the creator pointed at, and the "Wave 2" line is a label, not a mechanism. §5

2 **The reason is on the card, always.** A respondent who cannot see why they are being shown something has been retargeted, not helped — and the reason is always the same shape here, because the only fact the app has is which Verto they played. §5

3 The cheapest existing route to "here's your next Verto" is already in the product — per-end-screen `forward_url / forward_label ( survey.rb:2115 )` can already send different respondents to different links. What that cannot do is come back weeks later, feed `/you`, or be emailed. That is why this is a typed relationship rather than a second forward button. §5

Cut: a feed. Three creator-chosen follow-ups is a list; anything longer needs ranking, and ranking needs a model of the respondent that this app has deliberately never built.

IN THE LIST

Riverside Youth Trust via Playverto

A new Verto from Riverside Youth Trust

You answered "How safe do you feel after dark?" in March. Here's the follow-up.

OPENED

playverto

Riverside Youth Trust has a new one

You answered **How safe do you feel after dark?** in March, and they said they'd come back to you.

Getting home safely — what would help?

4 minutes · anonymous · you'll see how everyone answered as soon as enough people have.

Take it

Or open your account: <https://app.playverto.com/you>

You're getting this because you asked to hear from organisations whose Vertos you've answered.

Only stop emails from Riverside Youth Trust

Stop all Playverto emails

WHAT THE TWO LINKS HAVE TO MEAN

1 Only stop this organisation

A new scoped preference. Nothing in the app has one today.

4 Stop all Playverto emails

Today's `EmailSuppression` — unique on `email`, global, and shared with every creator campaign.

A respondent who unsubscribes today would also silence the results digest of a creator who happens to use the same address — and creators play their own Vertos, so that is a matter of time, not a hypothetical.

NOTES

- 1 The organisation is the sender in the reader's eyes; Playverto is the "via". That is the relationship the address was given for, and it is also what makes the per-organisation unsubscribe legible.
- 2 Sent through the existing `Comms::` suite, so batching, open/click tracking, suppression and RFC 8058 one-click unsubscribe come free. **But not by widening `verified_users`**: every non-list branch of `Comms::AudienceResolver` emits `user_id:`, and `email_campaign_recipients.user_id` has *no foreign key* — a Player id in that slot would silently dereference to whatever `User` holds it. The "list" branch already shows the right shape (`user_id: nil, contact_id:`); players need their own nullable column and their own branch. §8
- 3 `Comms::AutomationTriggers` is `{user:, anchor:, org_id:}` end to end and every trigger filters `User#email_verified_at`. "A new Verto from an organisation you answered" is a new subject type, not a fifth `when` branch. §8
- 4 **Two links, because one is not enough and the deck has to say which.** `EmailSuppression` is unique on `email` alone and subtracted globally by the resolver, so today there is only the second link — and pressing it would stop a creator's own mail to the same address. The scoped preference is new work, and it is not optional: without it the honest label on the only available link is "stop everything Playverto ever sends you", which nobody wants to offer a respondent who merely wants fewer emails from one council. §8

Not drawn: a digest that batches several organisations into one mail. It is the obvious saving and the wrong one — the unsubscribe would then have to be per-row inside a single message, and the sender in the reader's eyes would become Playverto.

NEW "ASK THEM TO JOIN" BLOCK, AFTER "AFTER THEY FINISH"

Impact & follow-ups

Language

NOTES

1

A new `details.publish-block` in the same panel, right after "After they finish" (`surveys/show.html.erb:1449`). Same inline-styled dark panel, and English like its neighbours — the Publish panel is not internationalised and this does not change that. [§4](#) [§10](#)

2

Off by default. This asks a respondent for an email address; it should be a thing a creator turns on, not a thing they discover they shipped. [§4](#)

3

Two caps per field, not one — the house pattern at `survey.rb:2075` : a `MAX_` that cuts, and a `RECOMMENDED_` where the counter turns amber. Proposed: heading 60/40, body 200/120, button reuses `MAX_END_LABEL` (40). [§4](#)

4

One field per `form_with` posting to `survey_settings_path` , with `onchange="this.form.requestSubmit()"` — the `tokens_note` shape. `#update_settings` has **no strong params**, only a `params.key?` ladder, so a field missed there is silently dropped while the form still looks saved. [§4](#)

5

Clearing a field restores the locale default rather than shipping a blank — the same "blank means default" contract as `thankyou_title_text` . And these four columns must join `Survey#duplicate!` , which today omits `tokens_note` , `leaderboard_note` , `share_enabled` and a dozen more. **A follow-up Verto is usually made by duplicating the first**, which is exactly when losing this copy would show. [§4](#)

6

The wall that already exists has to cover this too. `Survey#contact_form_excludes_neurodiversity` (`survey.rb:2410`) refuses `contact_form_enabled?` on any Verto asking the neurodiversity question, so health-adjacent special-category answers never sit beside a name and an email. A block that collects an email is a contact form by any reading — so it is refused here, in the same place, for the same reason. [§9](#)

5

Not in the panel, deliberately: a per-language override of this copy, and a "✦ Suggest" generator. The thank-you copy beside it isn't translated today either, and a three-field ask is not worth a Claude call.

NOTES

- 1

The count is the point of the block. A creator who can see that 214 people are waiting will write the update; one who sees an empty form will not. It is a count of `player_claims` on this Verto, minus suppressions. §5 §8
- 2

`impact_headline` (≤ 80) and `impact_body`. Available whether or not the Verto is closed – a decision can land while a Verto is still collecting, and there is no reason to make the creator wait. §5
- 3

The changed-things list is optional and repeatable. It is the part respondents actually read, and it is also the part a creator can genuinely fill in from a committee minute. §5
- 4

The one control in this panel that is not an autosave. Every other field here follows the `onchange="this.form.requestSubmit()"` convention; this one cannot, because pressing it sends 214 emails. The label says the number and says "once". §5 §8
- 5

And it says what a later edit does. Publishing sets `impact_published_at`; the presence of that timestamp is what stops a second send, so a typo fix is free. §5
- 6

Follow-ups are an ordered list of survey ids, picked from the creator's own organisation and reorderable. No cross-organisation picker: an organisation vouching for its own next Verto is a recommendation a respondent can weigh; one platform pointing at a stranger's is an ad. §5

Not here: a reminder that nags a creator who never writes an impact. If it is worth prompting, it is worth prompting in their own inbox – `Comms::AutomationTriggers` is where that would live, and it is a creator-facing trigger, not a respondent-facing one.

NOTES

- 1 Counts `player_claims` rows on this Verto — people, not taps. Sitting beside Responses is the point: it reframes the account from a thing the platform wants into an audience the creator now has. §2
- 2 Not on the tile, and deliberately: no email addresses and no list. The creator never sees who joined. They can publish an impact update and the platform delivers it — which is a different relationship from being handed 214 addresses, and the one the consent on board B actually describes. §9
- 3 Hidden entirely on a Verto with the block turned off, rather than showing a zero that reads as failure.

The obvious next tile — "opened the impact update" — is left out until there is an impact update to open. Adding a metric before the thing it measures exists is how dashboards fill up with zeroes.

§ What the boards imply — the spec for whoever builds it

Numbered to match the §n references in the notes. **Nothing here is built.** Two items — §3's prerequisite and §9's rewrite — are work that has to happen *before* or *alongside* the feature rather than after it.

- 1

A new `Player` , and its own session

`players` : `email_address` (normalised, unique), `name` , `preferred_locale` , `email_verified_at` . **No password column at all.** Sign-in is `generates_token_for :sign_in, expires_in: 20.minutes` , following the three flows `User` already has (`:password_reset` , `:account_setup` , `:email_confirmation`) — `Session` has no token column and must not grow one. Separate `player_sessions` table and a signed permanent `player_session_id` cookie, with `reset_session` at the privilege boundary as `Authentication#start_new_session_for` does. A `PlayerAuthentication` concern that never assigns `Current.session` (`Current` delegates `user` to it), and `/you` must skip `require_authentication` *and* `set_current_organisation` — the latter redirects a user with no membership straight to `new_session_path` (`organisation_scope.rb:39`). Add the new token endpoint to `PASSWORD_PATHS` in `auth_throttling_test.rb` .
- 2

`player_claims` — the only cross-Verto join, and it is not on `responses` (`player_id` , `survey_id` , `response_id` , `claimed_at` , `source`) , unique on (`player_id` , `response_id`) . **Do not add** `responses.player_id` . That column is precisely the cross-survey join key with a name and an email on the end of it that `survey.rb:1669` and `contact_detail.rb:1-13` promise does not exist; keeping the join here means `responses` is untouched, a careless creator-facing `select` cannot leak the account, and erasure has one place to look. Materialising `response_id` also insulates the account from a `secret_key_base` rotation — `render.yaml` sets `generateValue: true` , so a recreated service makes every stored digest uncomparable. Nothing may re-derive a digest at read time.
- 3

The claim exchange, and the prerequisite it has

`POST /you/claims` , two shapes in one call: `{session_token}` for the run just finished — always present, in the tab, single-use and bounded to shortly after `completed_at` — and a length-capped `[{token, player_key}]` for durable keys found in `localStorage` . Resolve tokens through `PlayerController#load_survey_and_share:1476` rather than re-implementing the four kinds (share token, link slug, publish token, vanity slug); an unresolvable token is skipped, not errored. **Model the endpoint on** `RespondentRecall` (`app/services/respondent_recall.rb:26` , `MAX_RECALL_CODES_PER_IP`): per-identity budgets on top of the rate limit, and refusals shaped exactly like successes, because "claimed N" is otherwise an oracle for which tokens resolve and which keys have responses. Distinct `name`: per limiter — the shared-counter bug has already been hit once (`player_controller.rb:12-64`). **Prerequisite:** `player_controller.js:3049` puts `player_key` in the leaderboard's *GET query string*, which `service-worker.js:147` caches with the query intact — against the rule stated at `routes.rb:9-11` . Move that call to `POST-with-body` before a key can buy an account.
- 4

Editable ask copy on `surveys`

`join_prompt_enabled` (boolean, default **false**), `join_title` , `join_body` , `join_cta` , each with a `*_text` reader falling back to a `player.join_*` key (`thankyou_title_text:2107` is the shape) and each with **two** caps in the house pattern (`MAX_NOTE = 200` / `RECOMMENDED_NOTE = 120` , `survey.rb:2075`): heading 60/40, body 200/120, button reusing `MAX_END_LABEL` (40). Saved through `#update_settings` in the `tokens_note` shape — note it has **no strong params**, only a `params.key?` ladder, so a field missed there is silently dropped while the form appears to save. **Not in** `SETTINGS_LOCKED_IN_USE` : that list is refused wholesale (`surveys_controller.rb:960`) and `editing_locked?` is true for every live Verto, so locked copy would be uneditable exactly when it matters. Add all four to `Survey#duplicate!` , which today omits `tokens_note` , `leaderboard_note` , `share_enabled` , `regions_enabled` , `contact_form_enabled` , `respondent_code_*` , `capture_postcode` and the `token_*` display flags.
- 5

Impact and follow-ups on `surveys`

`impact_headline` (≤ 80), `impact_body` , an optional ordered list of "what changed" lines, an optional link, and `impact_published_at` . Follow-ups are an ordered list of survey ids scoped to the creator's own organisation. **Publishing is a deliberate action, not an autosave** — it is the one control in that panel that cannot follow the `onchange="this.form.requestSubmit()"` convention, because it sends mail; the presence of `impact_published_at` is what prevents a second send, so later edits are free. Nothing resembling this exists today: the nearest hooks are the per-card `outcome` sentence (`survey.rb:863`) and per-end-screen `forward_url` (`survey.rb:2115`), and neither can come back weeks later, feed `/you` , or be emailed.
- 6

The cache and service-worker boundary

`/you` sits outside `/play/` because that path is the worker's entire scope and its HTML is cached for offline use. `you` joins `NOINDEX_PATHS` (`application_controller.rb:19`) and carries `Cache-Control: no-store` in the `Comms::TrackingController:26` shape. Inside the player, the join block's **per-Verto copy is ERB** (busted for free by `survey.updated_at` , no `CACHE_VERSION` bump) and its **per-person state is drawn client-side** into a hidden target, as `_renderTokenScore` and `_renderLeaderboard` already are — `cached_play_page` (`player_controller.rb:1216`) is one body shared by every respondent, and its own header says "nothing per-respondent is rendered into it". **The one thing here that does need a** `CACHE_VERSION` **bump** (`service-worker.js:34` , currently `playverto-v41`): excluding the "am I signed in" endpoint from `networkFirst(PAGE_CACHE)` , because every same-origin GET a `/play/` page makes goes through that handler regardless of path.
- 7

The wallet's arithmetic, and what it must not claim

Piles come from `responses.token_totals` keyed on (`survey_id` , `token_id`) — token ids are *not* unique, because `duplicate!` copies `token_types` verbatim and `sanitize_token_types` passes creator-supplied ids straight through (`survey.rb:1531`). The headline total is the same summation `LeaderboardStanding#total` already performs, one level up; there is **no cross-Verto ranking**, because award sizes are a creator's free choice. Standings and the anonymous name come from the Verto's own `LeaderboardStanding` and `PlayerAlias` , per-Verto, un-merged. **One open decision the boards surface rather than settle:** `apply_token_totals` recomputes from the *current* cards on every save (`player_controller.rb:1155`) and the comparison aggregates are cached in 10-second windows — so either the claim snapshots totals at completion, or the wallet is a live view whose numbers can move when a creator edits awards. Pick one and say so in the UI.
- 8

Mail, and the unsubscribe collision

The sign-in mail is a transactional mailer in the house shape: both an `.html.erb` and a `.text.erb` , `headers["X-Entity-Ref-ID"]` , and `I18n.with_locale` applied explicitly because a mailer runs in a job with no `Current.locale` (`WelcomeMailer` is the model). "The next one is out" goes through `Comms::` — but **not** by widening `verified_users` : every non-list branch of `Comms::AudienceResolver` emits `user_id` , and `email_campaign_recipients.user_id` has **no foreign key**, so a `Player` id there silently dereferences to whatever `User` holds it. The "list" branch already shows the right shape (`user_id: nil` , `contact_id:`); players need their own nullable column and their own branch, plus their own `email_verified_at` filter. `AutomationTriggers` is `{user:, anchor:, org_id:}` end to end — this is a new subject type, not a fifth `when` . **And** `EmailSuppression` **is unique on** `email` **alone and subtracted globally**, so a respondent unsubscribing would silence every creator campaign to that address — and the same person is routinely both. A scoped preference alongside the global opt-out is required, not optional (board H).

9 Consent, the wall that already exists, and the rights paths that do not

The account is a new, explicitly given lawful basis, taken on the landing page (board B) rather than on the end screen. It neither reads nor writes `ContactDetail` , and small-cell suppression (`MIN_REGION_SAMPLE_SIZE = 5`) still binds every aggregate on `/you` .

`Survey#contact_form_excludes_neurodiversity` (`survey.rb:2410`) **does not currently cover this and must.** It refuses `contact_form_enabled?` on any Verto asking the neurodiversity question so special-category answers never sit beside a name and an email – and a block collecting an email is a contact form by any reading. **The rights paths are not wired:**

`RespondentDataExport.lookup:22` matches only `session_token` or a respondent code, so an Article 15 export would omit the account, its claims and its wallet; `RespondentDataController#destroy` clears contacts and aliases then `responses.destroy_all` , knowing nothing of `player_claims` . That controller is also deliberately creator-facing ("the creator is the data controller") – a Player is the first self-service respondent identity and needs its own delete-my-account path. Decide, too, what happens on a Verto that has both respondent codes and a join prompt: two competing respondent identities.

10 Strings, and the parity gap they fall through

New `player.join_*` and `you.*` keys in `en.yml` and the other 24 hand-written locale files, then `bin/rails i18n:en_us` to regenerate `en-US.yml` (`LocaleEnUsTest` fails if it is stale). `player` **is not in** `LocaleStructureParityTest::NAMESPACES` (`js defaults card templates demographics ask unsubscribe` , `locale_structure_parity_test.rb:17`) – so a locale file missed under `player.join_*` fails nothing and ships as English. Add the new `you` namespace to that list, and decide whether `player` joins it. The block's per-Verto copy is server-rendered and needs no JS plumbing; the states the client draws ("Check your inbox", the inline email error) must live under `js:` or in the curated slice in `_i18n_js.html.erb` , or they render as raw dotted keys (BUG-004). Editor strings stay English, like the rest of the Publish panel. Tests: claim idempotency, cross-survey isolation and the oracle-shaped refusal; magic-link expiry and single use; `/you` authorisation and that it escapes `set_current_organisation` ; the editor copy round-trip in the `token_notes_test.rb` shape; a mailer test in the `welcome_mailer_test.rb` shape (both parts, locale, `I18n.locale` restored).

WHAT THE CODEBASE SAYS TODAY	WHERE	WHAT THIS FEATURE DOES TO IT	MUST BE REWRITTEN IN THE SAME CHANGE?
"the per-survey key means a digest is comparable only within this Verto, so identities can't be joined across surveys"	<code>app/models/survey.rb:1669</code>	Still true of digests. An account joins Vertos by the keys the respondent hands over, never by comparing digests.	Yes – qualify it
"contacts, like aliases, cannot be joined across Vertos"	<code>app/models/contact_detail.rb:1-13</code>	Still true of <code>ContactDetail</code> , which this feature does not touch. But a second, consented identity now exists alongside it.	Yes – qualify it
"No email address, name or account is attached to a response"	<code>docs/DATA_RETENTION.md:30</code>	False once <code>player_claims</code> exists – the link is one hop away rather than on the row.	Yes – it becomes wrong
"storing a durable identifier ... trades a privacy property for a rights one. That is a product decision, not a bug fix, and it is not made here."	<code>docs/DATA_RETENTION.md:154-172</code>	This feature is that product decision, taken deliberately.	Yes – it is now made
"nothing per-respondent is rendered into it" (the cached play page)	<code>player_controller.rb:1189</code>	Stays true. The join block's per-person state is drawn client-side precisely so it does.	No – it still holds
A respondent handle in a URL "lands in server logs, in Referer headers and in the service worker's page cache"	<code>config/routes.rb:9-14</code>	Stays true – which is why the leaderboard's <code>player_key</code> GET has to move to a POST body first (§3).	No – it forces work
A Verto may hold contact rows or ask the neurodiversity question, never both	<code>survey.rb:2410</code>	Must extend to cover the join block, or the wall has a second door.	Yes – extend the rule
Subject access and erasure are keyed on <code>session_token</code> or a respondent code	<code>respondent_data_export.rb:22</code>	Neither knows about accounts; an export would be incomplete and a deletion would orphan claims.	Yes – before launch

Left out, and why

- **A password, and social sign-in.** Two Vertos can be six months apart. A password would be forgotten by the second one, and a Google button is a second identity provider to reason about for an account that holds four survey responses.
- **A cross-Verto leaderboard.** Award sizes are a creator's free choice, so it would rank people by whose Verto they happened to play. The total stays; the table does not.
- **Streaks, levels, badges, and anything that spends.** Creator tokens are a device for getting through *that* creator's Verto. Making them a platform currency turns every creator's design choice into a lever on someone else's score.
- **A recommendation feed.** Three creator-chosen follow-ups is a list. Anything longer needs ranking, and ranking needs a model of the respondent this app has deliberately never built.
- **Giving creators the list of addresses.** They see a count (board K) and can publish an update the platform delivers. That is a different relationship from being handed 214 addresses, and it is the one the consent on board B describes.
- **A digest that batches several organisations into one email.** The obvious saving and the wrong one: the unsubscribe would have to become per-row inside one message, and the sender in the reader's eyes would stop being the organisation.
- **Per-language overrides of the ask copy, and a "✦ Suggest" generator for it.** The thank-you copy beside it isn't translated today either, and three short fields are not worth a Claude call.
- **An impact score, or any aggregate of impact.** It would be a number with nothing behind it.
